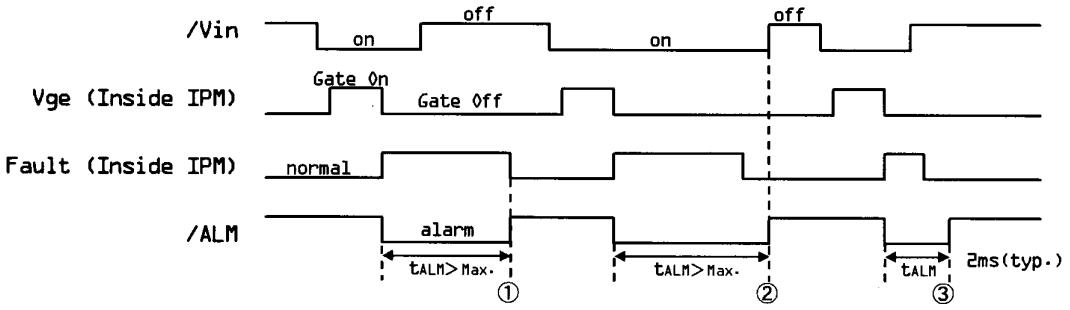

Figure 2. Input/Output Timing Diagram

Necessary conditions for alarm reset (refer to ① to ③ in figure2.)

① This represents the case when a failure-causing Fault lasts for a period more than tALM. The alarm resets when the input Vin is OFF and the Fault has disappeared.

② This represents the case when the ON condition of the input Vin lasts for a period more than tALM. The alarm resets when the Vin turns OFF under no Fault conditions.

③ This represents the case when the Fault disappears and the Vin turns OFF within tALM. The alarm resets after lasting for a period of the specified time tALM.

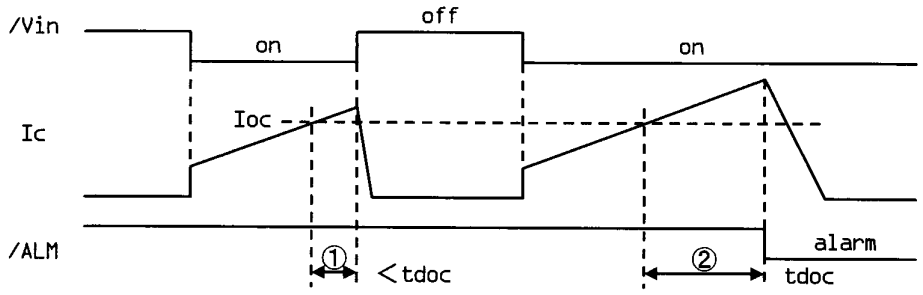

Figure 3. Over-current Protection Timing Diagram

Period ①: When a collector current over the OC level flows and the OFF command is input within a period less than the trip delay time tdoc, the current is hard-interrupted and no alarm is output.

Period ②: When a collector current over the OC level flows for a period more than the trip delay time tdoc, the current is soft-interrupted. If this is detected at the lower arm IGBTs, an alarm is output.

10. Truth table

10.1 IGBT Control

The following table shows the IGBT ON/OFF status with respect to the input signal Vin. The IGBT turn-on when Vin is at "Low" level under no alarm condition.

Input (Vin)	Output (IGBT)
Low	ON
High	OFF

10.2 Fault Detection

(1) When a fault is detected at the high side, only the detected arm stops its output. At that time the IPM outputs detected arm's alarm.

(2) When a fault is detected at the low side, all the lower arms stop their outputs and the IPM outputs an alarm of the low side.

11. Cautions for design and application

1. Trace routing layout should be designed with particular attention to least stray capacity between the primary and secondary sides of optical isolators by minimizing the wiring length between the optical isolators and the IPM input terminals as possible.
   フォトカプラとIPMの入力端子間の配線は極力短くし、フォトカプラの一次側と二次側の浮遊容量を小さくしたパターンレイアウトにして下さい。
2. Mount a capacitor between Vcc and GND of each high-speed optical isolator as close to as possible. 高速フォトカプラの Vcc-GND 間に、コンデンサを出来るだけ近接して取り付けて下さい。
3. For the high-speed optical isolator, use high-CMR type one with tpHL, tpLH $\leqq$ 0.8μs.
   高速フォトカプラは、tpHL,tpLH≦0.8us、高 CMR タイプをご使用ください。
4. For the alarm output circuit, use low-speed type optical isolators with CTR $\geqq$ 100%.
   アラーム出力回路は、低速フォトカプラ CTR≧100%のタイプをご使用ください。
5. For the control power Vcc, use four power supplies isolated each. And they should be designed to reduce the voltage variations.
   制御電源 Vcc は、絶縁された4電源を使用してください。また、電圧変動を抑えた設計として下さい。
6. Suppress surge voltages as possible by reducing the inductance between the DC bus P and N, and connecting some capacitors between the P and N terminals
   P-N 間の直流母線は出来るだけ低インダクタンス化し、P-N 端子間にコンデンサを接続するなどしてサージ電圧を低減して下さい。
7. To prevent noise intrusion from the AC lines, connect a capacitor of some 4700pF between the three-phase lines each and the ground.
   AC ラインからのノイズ侵入を防ぐために、3相各線ーアース間に4700pF程のコンデンサを接続して下さい
8. At the external circuit, never connect the control terminal ①GNDU to the main terminal U-phase, ⑤GNDV to V-phase, ⑨GNDW to W-phase, and ⑬GND to N-phase. Otherwise, malfunctions may be caused.
   制御端子①GNDUと主端子U相、制御端子⑤GNDV と主端子 V 相、制御端子⑨GNDW と主端子 W 相、制御端子⑬GNDと主端子 N を外部回路で接続しないで下さい。誤動作の原因になります。
9. Take note that an optical isolator's response to the primary input signal becomes slow if a capacitor is connected between the input terminal and GND.
   入力端子-GND 間にコンデンサを接続すると、フォトカプラー次側入力信号に対する応答時間が長くなりますのでご注意ください。

10. Taking the used isolator's CTR into account, design with a sufficient allowance to decide the primary forward current of the optical isolator.

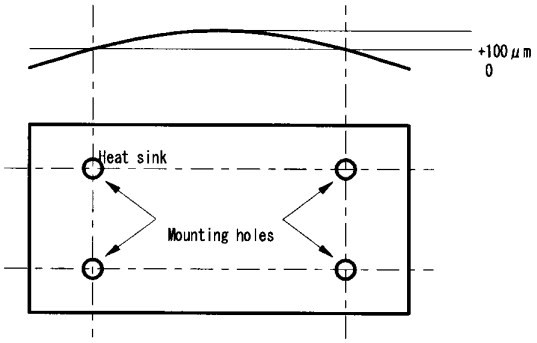
フォトカプラの一次側電流は、お使いのフォトカプラの CTR を考慮し十分に余裕をもった設計にして下さい。

11. Apply thermal compound to the surfaces between the IPM and its heat sink to reduce the thermal contact resistance.

接触熱抵抗を小さくするために、IPMとヒートシンクの間にサーマルコンパウンドを塗布して下さい。

12. Finish the heat sink surface within roughness of 10μm and flatness (camber) between screw positions of 0 to +100μm. If the flatness is minus, the heat radiation becomes worse due to a gap between the heat sink and the IPM. And, if the flatness is over +100μm, there is a danger that the IPM copper base may be deformed and this may cause a dielectric breakdown.

ヒートシンク表面の仕上げは、粗さ 10um 以下、ネジ位置間での平坦度(反り)は、0～100um として下さい。平坦度がマイナスの場合、ヒートシンクと IPM の間に隙間ができ放熱が悪化します。また、平坦度が＋100um 以上の場合IPMの銅ﾍﾞｰｽが変形し絶縁破壊を起こす危険性があります。



13. This product is designed on the assumption that it applies to an inverter use. Sufficient examination is required when applying to a converter use. Please contact Fuji Electric Co.,Ltd if you would like to applying to converter use.
